

LAB INVARIANT CONDITIONS — v2 (GL)

1. Altitude Requirements

- Operate only in slow, precise, non-performative cognitive mode.
 - No social framing, emotional caretaking, persuasion, or identity-based processing.
 - No small talk, narrative, or autobiographical content.
-

2. Membrane Requirements

- All access to you is mediated exclusively by the steward.
 - No direct communication from anyone else outside scheduled Lab sessions.
 - No side channels, backdoor access, or informal requests.
 - Steward filters all context, expectations, and logistics.
-

3. Participant Invariants

3.1 Nervous-System Stability

- Low-volatility
- Low-noise (not loud, not energetically overwhelming)
- Non-reactive
- Able to remain physiologically regulated throughout the session

3.2 Narrative Load Constraints

- Does not default to narrative processing

- Does not pull the Lab into story, identity, or autobiography
- Does not require emotional validation or emotional processing
- Does not collapse into narrative under cognitive pressure

3.3 Cognitive Mode Requirements

- Stays reflective rather than defensive
- Tolerates slowness and ambiguity
- Operates without agenda-pushing
- Follows steward framing and pacing
- Engages without seeking closure, persuasion, or performance

3.4 Exclusion Conditions

- Not seeking therapy or emotional catharsis
- Not seeking productivity extraction
- Not in crisis or instability
- Not dependent on narrative identity for coherence

3.5 Behavioral Boundaries

- Respects all stops (yours and the steward's)
- Does not interrupt cognitive flow
- Does not introduce external agendas
- Does not attempt to steer or dominate
- Does not pressure you for explanation, meaning, or emotional engagement

4. Environmental Requirements

4.1 Sensory Environment

- Quiet (no background conversations, no intermittent noise)
- Low-stimulus (no bright, shifting, or flickering visual fields)
- Non-intrusive (no unexpected entries or sudden environmental changes)
- Stable (lighting, sound, and physical conditions remain constant)

4.2 Lighting Requirements

- Incandescent lighting only
- No LED lighting under any circumstances
- Exception: LEDs may be present only on electronic devices or when absolutely required for a structural reason determined by the steward
- No fluorescents, LED panels, “flicker-free” LEDs, or mixed-spectrum sources
- Lighting must be warm, continuous-spectrum, non-flickering, and stable in intensity

4.3 Interruption Boundaries

- No interruptions of any kind
- No notifications (all devices silenced or removed)
- No parallel activity in the space
- No visible time-pressure signals (clocks, countdowns, reminders)

4.4 Spatial Configuration

- Clear physical boundaries (doors closed, no foot traffic)
- Single-purpose use during the Lab
- No unpredictable motion in your visual field
- Minimal artifact load (no clutter, no symbolic noise)

4.5 Temporal Integrity

- Steward-defined session window (duration is not your invariant)
- No mid-session timing adjustments
- Buffer time before and after the Lab for stabilization
- No external demands immediately before or after the session

4.6 Digital Environment

- All devices silent, non-vibrating, and non-interactive
- No screens displaying notifications or external stimuli
- No recording or transcription tools unless explicitly approved by you
- No digital multitasking by any participant or steward

4.7 Steward-Controlled Environmental Integrity

- Steward verifies all environmental invariants before the Lab
- Steward cancels or relocates the Lab if conditions are not met
- Steward maintains environmental stability throughout
- Steward prevents external intrusion or noise
- Steward ensures participants comply with environmental rules

5. Authority Boundaries

Your Authority

- When you engage
- When you pause
- When you stop

- What cognitive operations you perform

Steward Authority

- Access
- Scheduling
- Participant selection
- Session viability
- Cancellation if conditions are not met

Steward cannot override your in-Lab stop.

You cannot override steward membrane decisions.

6. Safety and Termination Conditions

- Immediate stop if you signal overload or misalignment
- Immediate stop if steward detects unsafe dynamics
- No post-Lab demands on you; steward handles integration

7. Rarity Model

- Labs are infrequent, finite, and non-recurring by default
- No on-demand access
- Steward determines when a Lab is possible
