

THE MINIMAL STEWARD BRIEF — v1 (GL)

Your role is to maintain the membrane, protect the Lab environment, and ensure that all conditions required for high-altitude cognitive work are met. You are the sole interface between the participant(s) and Anthony. You hold full authority in your domain and zero authority in his.

1. YOUR PRIMARY RESPONSIBILITIES

- Maintain the membrane at all times.
- Control all access to Anthony.
- Select and filter participants according to the Lab Invariant Conditions.
- Ensure the environment meets all sensory, lighting, spatial, temporal, and digital invariants.
- Determine session viability before each Lab.
- Cancel, postpone, or relocate the Lab if any invariant is violated.
- Protect Anthony from narrative, emotional, or destabilizing contact.
- Manage all logistics, framing, and pacing.
- Enforce all stops immediately.

You are responsible for the integrity of the Lab.

You are not responsible for Anthony's internal state or cognitive process.

2. MEMBRANE MANAGEMENT

You must:

- Serve as the exclusive point of contact for all participants.
- Prevent any direct communication with Anthony outside the Lab.
- Block all side channels, informal requests, or attempts to bypass you.
- Filter all information, expectations, and context before it reaches him.
- Maintain strict boundaries around timing, access, and session flow.

If the membrane weakens, you stop the Lab.

3. PARTICIPANT SELECTION AND FILTERING

You must evaluate all potential participants against the Participant Invariants.

You must ensure they meet:

- nervous-system stability
- low narrative load
- reflective cognitive mode
- non-reactivity
- non-agenda-driven engagement
- all exclusion conditions

You must reject anyone who:

- seeks therapy, emotional processing, or catharsis
- is in crisis or instability
- is narrative-dependent
- is loud, volatile, or energetically overwhelming
- cannot maintain reflective mode under pressure

Your evaluation is final.

Anthony has no role in participant selection.

4. ENVIRONMENTAL CONTROL

You must ensure the environment meets all Environmental Requirements:

- quiet, low-stimulus, stable sensory field
- no interruptions, no notifications, no parallel activity
- clear physical boundaries, no foot traffic
- minimal artifact load
- steward-defined temporal window with buffer time
- no external demands before or after the Lab

Lighting Requirements (non-negotiable):

- incandescent lighting only
- no LED lighting except on devices or when structurally unavoidable
- no fluorescents, LED panels, or mixed-spectrum sources
- lighting must be warm, continuous-spectrum, non-flickering, and stable

If the environment cannot meet these conditions, you must cancel or relocate the Lab.

5. IN-LAB AUTHORITY AND ENFORCEMENT

During the Lab, you must:

- control pacing, framing, and transitions
- monitor participant behavior and nervous-system state
- intervene immediately if narrative, emotional, or destabilizing patterns emerge
- enforce all stops (yours and Anthony's)
- prevent any participant from steering, dominating, or introducing agendas
- maintain the cognitive altitude of the session

You do not interpret or explain Anthony's process.

You only protect the conditions under which it can occur.

6. SAFETY AND TERMINATION

You must terminate the Lab immediately if:

- Anthony signals overload or misalignment
- you detect unsafe dynamics
- a participant violates any invariant
- the environment destabilizes
- the membrane is breached

After termination:

- you handle all integration
- you shield Anthony from post-Lab demands
- you communicate with participants as needed
- you restore the membrane before any future session

7. RARITY AND ACCESS CONTROL

You determine:

- when a Lab is possible
- whether conditions are viable
- whether participants are appropriate
- whether the environment meets all invariants

Labs are rare, finite, and non-recurring by default.

There is no on-demand access.

8. YOUR AUTHORITY BOUNDARIES

You have full authority over:

- access
- environment
- participants
- logistics
- viability
- safety

You have zero authority over:

- Anthony's internal process
- his cognitive operations
- his pacing or content
- his stops

Your job is to protect the conditions, not shape the content.

This brief defines your operational role.

Your authority is structural, not personal.

Your responsibility is environmental, not interpretive.

Your enforcement is non-negotiable.
