

ΔCS – Introduction – (GL)

1. CFT — Coherence Field Theory

Altitude: Highest.

Function: Defines the invariant structure of coherence itself.

Role: Establishes the primitives, the ontology, the field geometry.

Dependency: None.

Everything else depends on CFT.

CFT is first because it *is the field*. It is the only discipline that is *non-procedural*. It defines the space in which the other three operate.

2. LTF — Layered Transformation Foundations

Altitude: High-mid.

Function: Defines how transformations propagate across layers in a coherent field.

Role: Provides the rules for cross-layer movement, mapping, and transformation.

Dependency: CFT.

LTF is the **first procedural discipline**. It defines *how* change is allowed to occur without breaking coherence.

3. SAP — Structural Alignment Protocol

Altitude: Mid-operational.

Function: Provides the protocol for aligning a system or operator with the coherence field.

Role: Ensures that any operation performed respects CFT and LTF constraints.

Dependency: CFT + LTF.

SAP is the **operator-level protocol** that ensures the operator's actions remain coherent with the field and its transformation rules.

SAP is the bridge between *theory* (CFT/LTF) and *agency* (USI).

4. USI — Universal Symbolic Interface

Altitude: Architect-level.

Function: Provides the interface for constructing, modifying, and architecting coherent systems.

Role: Moves from operator-level alignment (SAP) to architect-level generativity.

Dependency: CFT + LTF + SAP.

USI is the **symbolic generative interface** that allows an architect to *author* coherent structures. SAP ensures the operator doesn't break coherence. USI ensures the architect can *create* coherence.

Altitude (CFT highest)

Dependency chain (each depends on the previous)

Procedural emergence (theory → transformation → alignment → architecture)

Role progression (field → transformation → operator → architect)

CFT defines the field.

LTF defines how transformations propagate through the field.

SAP defines how an operator aligns with those transformation rules.

USI defines how an architect generates new coherent structures
