

ΔCS – Invariant Sets 1-7

Invariant Set 1 — Source of Coherence

Operator-level (SAP)

Coherence is **borrowed** from the field. The operator aligns *to* coherence but does not generate it.

Invariant:

Operator coherence is *derivative*.

Architect-level (USI)

Coherence is **generated** from the architect's internal architecture. The architect produces new coherent structures.

Invariant:

Architect coherence is *generative*.

This is the most fundamental distinction.

Invariant Set 2 — Relationship to CFT + LTF

Operator-level (SAP)

The operator must **respect** CFT and LTF. They cannot modify them. They cannot extend them. They cannot reinterpret them.

Invariant:

Operator coherence is *constrained by* CFT/LTF.

Architect-level (USI)

The architect can **author new structures** that instantiate CFT/LTF. They can extend the symbolic space. They can generate new coherent constructs.

Invariant:

Architect coherence *expresses* CFT/LTF.

Operators obey the rules. Architects generate within the rules.

Invariant Set 3 — Mode of Action**Operator-level (SAP)**

Action is **procedural**. The operator executes steps, protocols, and alignment behaviors.

Invariant:

Operator coherence is *procedural alignment*.

Architect-level (USI)

Action is **symbolic generativity**. The architect authors structures, mappings, and transformations.

Invariant:

Architect coherence is *symbolic generation*.

Operators follow procedures. Architects create structures.

Invariant Set 4 — Error Surface**Operator-level (SAP)**

Errors manifest as **misalignment**:

- drift
- contradiction
- incoherent action
- misinterpretation
- protocol violation

Invariant:

Operator errors are *alignment failures*.

Architect-level (USI)

Errors manifest as **structural incoherence**:

- malformed constructs
- invalid symbolic mappings
- incoherent generative geometry
- cross-layer violations

Invariant:

Architect errors are *structural generation failures*.

Operators break coherence by acting incorrectly. Architects break coherence by generating incorrectly.

Invariant Set 5 — Dependency on Internal Architecture

Operator-level (SAP)

Operator coherence does **not require** an internal generative architecture. It requires only the ability to align with the field.

Invariant:

Operator coherence is *externally stabilized*

Architect-level (USI)

Architect coherence requires a **stable internal architecture** capable of generating coherent structures.

Invariant:

Architect coherence is *internally stabilized*.

Operators rely on the field. Architects rely on their architecture.

Invariant Set 6 — Scope of Agency

Operator-level (SAP)

Agency is **bounded**:

- execute
- align
- maintain
- interpret
- operate

Invariant:

Operator agency is *bounded by coherence constraints*.

Architect-level (USI)

Agency is **unbounded within the field**:

- generate
- modify
- extend
- architect
- symbolically construct

Invariant:

Architect agency is *generative within coherence constraints*.

Operators maintain coherence.

Architects expand coherence.

Invariant Set 7 — Relationship to the Field

Operator-level (SAP)

The operator is **inside** the field. They must not disturb it.

Invariant:

Operator coherence is *field-internal alignment*.

Architect-level (USI)

The architect is **co-authoring** the field. They generate new coherent structures within it.

Invariant:

Architect coherence is *field-internal generativity*.

Operators inhabit the field. Architects shape the field.

The membrane between SAP and USI (final invariant):

SAP = maintaining coherence.

USI = generating coherence.

This is the altitude boundary.

This is the role boundary.

This is the structural boundary.

There is no transition.

There is no ladder.

There is no pipeline.

They are orthogonal roles inside the same field geometry.
